# Fast and convenient way to setup production order locations

Creating a production order only to realize you now must manually fill locations on production order lines and components isn't something you wish for. Using only one location for all components or taking care of numerous stockkeeping units to get what you want isn't the best way to use your time. A solution is to have a single page with setup for all your production order locations.

The screenshot shows the Dynamics 365 Business Central interface for the 'PO Locations' page. The page title is 'PO Locations' with a 'Saved' status. The navigation bar includes 'Search', '+ New', 'Edit List', and 'Delete'. The main content is a table with the following columns: 'Output Location Code ↑', 'Item Category Code ↑', 'Default Location Code', 'Output Location ↑', and 'Default Bin Code'. The table contains the following data:

Output Location Code ↑	Item Category Code ↑	Default Location Code	Output Location ↑	Default Bin Code
	CHAIR	NORTH	<input checked="" type="checkbox"/>	
	DESK	EAST	<input checked="" type="checkbox"/>	
	PARTS	MAIN	<input type="checkbox"/>	
	MATERIAL	MAIN	<input type="checkbox"/>	
	BOX	PACKAGING	<input type="checkbox"/>	A001
→ NORTH	⋮ PARTS	EAST	<input type="checkbox"/>	

## CHALLENGES

Production businesses use various raw materials and different locations to store them (whether they are virtual or physical locations). A production operation taking place at one machine center can use materials from different locations. Locations used on production order lines can also be different, depending on items produced.

## IDEAL SOLUTION

Since various items are categorized using item categories, they can be used to setup locations on production order lines and production order component lines. This makes setup and maintenance much faster and easier. You can also define production order component locations depending on location used on production order lines.

## DESIRED OUTCOMES

A single page with complete production order locations setup. Production order locations are filled automatically when production order is created.

## Production order locations add-on

Fill locations on production order lines and production order components automatically using a single page setup.

1

### FAST AND EASY SETUP

Using item categories to define production order locations is much faster than alternative methods. Process control is done from a single page.

2

### AUTOMATE PROCESSES AND AVOID ERRORS

Once production order locations setup is completed, it always works the same, just the way you want it to.

3

### SAVE TIME

Use your time efficiently, without unnecessary data input.

# Benefits of using Microsoft software solutions

Microsoft is well known as an industry trendsetter and technological leader for a long time now, making the best software solutions in the world. Using Microsoft Dynamics 365 products brings you stability and safety.

## EASE OF INTEGRATION WITH OFFICE SUITE

Integrate ERP, BI and Office suite seamlessly to maximize productivity.

## LOW INITIAL INVESTMENT

Scalable solutions adapt to your needs and desires instantly. Your ERP is automatically upgraded.

## PARTNER NETWORK

Use Microsoft partner network to access, try and implement various upgrades.
